Support Vector Machines

Part 3: Key Takeaways

(Hard margin) Support Vector Machines

Minimize $||w||^2$ subject to: $y^{(i)}(\mathbf{w} \cdot \mathbf{x}^{(i)} + \mathbf{b}) \ge 1$ for all i

Example of a **convex optimization** problem

- A quadratic program
- Polynomial-time algorithms to solve!

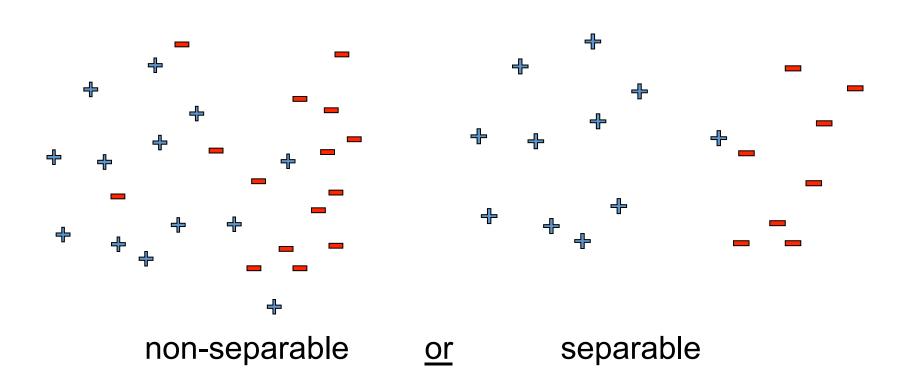

Non-support Vectors:

- everything else
- moving them will not change w

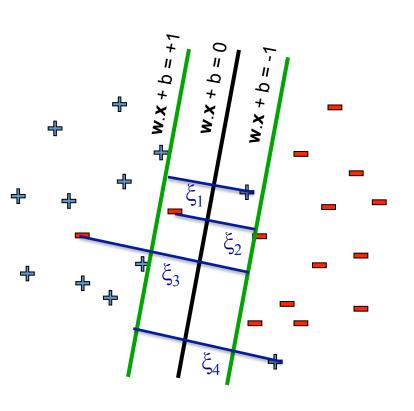

Support Vectors:

 data points on the margin lines

But what if you have:

"Soft margin SVM"

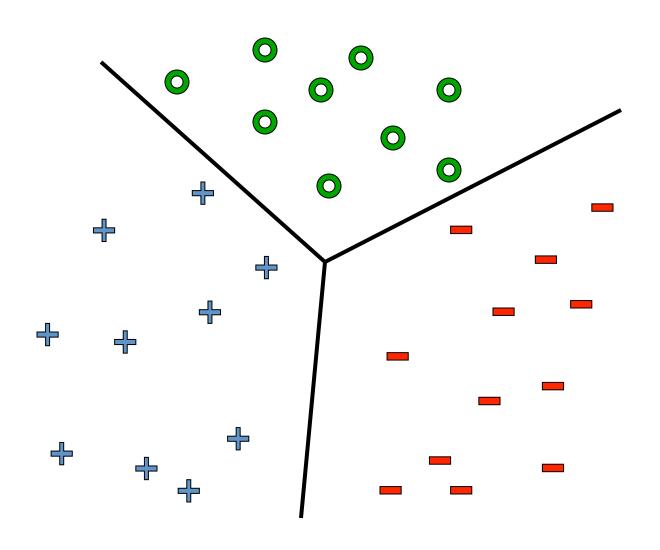

Minimize_{**w**,b, ξ} **w**•**w** + C $\Sigma_i \xi^{(i)}$ subject to $(\mathbf{w} \bullet \mathbf{x}^{(i)} + \mathbf{b}) \mathbf{y}^{(i)} \ge 1 - \xi^{(i)}$ for all i $\xi^{(i)} \ge 0$ for all i

Slack penalty C > 0:

- Want to find **w**, b so that the the margin is large and the # of errors is small.
- Want large margin to prevent overfitting.
- Solve optimization problem for different values of C. Choose the C that gives the smallest validation error.

How do we do multi-class classification?

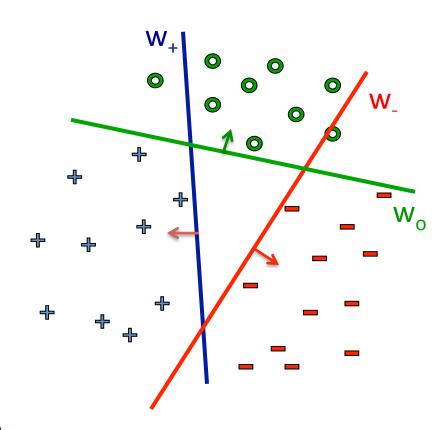

Multi-class SVM

Each example is now labeled either y = +, -, o.

We will simultaneously learn 3 sets of weights: $\mathbf{w}_{+}, \mathbf{w}_{-}, \mathbf{w}_{o}$ and three biases: b_{+}, b_{-}, b_{o}

Ideally, for each example, the "score" of the correct class will be better than the "score" of wrong classes, e.g, for a + examples, want:

$$\mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} > \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} > \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \text{for } \mathbf{y}^{(i)} = \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{+} = \mathbf{w}_{-} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{+} \bullet \mathbf{x}^{(i)} + \mathbf{b}_{-} \quad \mathbf{w}_{-} \bullet \mathbf{x}^{$$

Multi-class SVM

- May not be a feasible solution
- But we can allow for slack, and try to maximize the margin as before:

$$\begin{aligned} & \text{Minimize}_{\mathbf{w},\mathbf{b},\xi} \\ & \mathbf{w}_{+} \bullet \mathbf{w}_{+} + \mathbf{w}_{-} \bullet \mathbf{w}_{-} + \mathbf{w}_{o} \bullet \mathbf{w}_{o} + C \; \Sigma_{i} \; \xi^{(i)} \\ & \text{subject to} \end{aligned}$$

$$\mathbf{w}_{y(i)} \cdot \mathbf{x}^{(i)} + \mathbf{b}_{y(i)} \ge \mathbf{w}_{y'} \cdot \mathbf{x}^{(i)} + \mathbf{b}_{y'} + 1 - \xi^{(i)}$$
 for all $y' \ne y(i)$, for all i

(To predict, we use:
$$\hat{y} \leftarrow rg\max_k \ w_k \cdot x + b_k$$

Dual Formulation of Soft-Margin SVM

Maximize:

$$\Sigma_{i} \alpha_{i} - \frac{1}{2} \Sigma_{i,j} y^{(i)} y^{(j)} \alpha_{i} \alpha_{j} \mathbf{x}^{(i)} \mathbf{x}^{(j)}$$
s.t.
$$\Sigma_{i} \alpha_{i} y^{(i)} = 0$$

$$0 \le \alpha_{i} \le C \text{ for } i$$

- α_i 's are now the variables in the optimization problem
- m variables
- m+1 constraints

y
$$\leftarrow$$
 sign [$\Sigma_i \alpha_i y^{(i)} \mathbf{x} \cdot \mathbf{x}^{(i)} + \mathbf{b}$]

Soft SVM with kernels

Maximize:

$$\Sigma_{i} \alpha_{i} - \frac{1}{2} \Sigma_{i,j} y^{(i)} y^{(j)} \alpha_{i} \alpha_{j} K(\mathbf{x}^{(i)}, \mathbf{x}^{(j)})$$
s.t. $\Sigma_{i} \alpha_{i} y^{(i)} = 0$

$$0 \le \alpha_{i} \le C \text{ for } i$$

- Can replace x•z with more general function K(x,z)
- With the proper choice of function, can give much better results
 - Corresponds to non-linear decision region in original feature space
- But can't use just any function K(x,z)
 - Must be able to write K(x,z) as $K(x,z) := \varphi(x) \cdot \varphi(z)$ where $\varphi(x)$ is some vector function of x

Common kernels

Polynomials of degree exactly d

$$K(\mathbf{x}, \mathbf{z}) = (\mathbf{x} \cdot \mathbf{z})^d$$

Polynomials of degree up to d

$$K(\mathbf{x}, \mathbf{z}) = (\mathbf{x} \cdot \mathbf{z} + 1)^d$$

Gaussian kernels

$$K(\mathbf{x}, \mathbf{z}) = \exp(-\frac{\|\mathbf{x} - \mathbf{z}\|_2^2}{2\sigma^2})$$

And many others!
